Executive Summary:

Project Ala is an *in situ* lemur conservation project, establishing four habitat corridors between five fragmented patches of vital lemur forest habitat in a recently protected area of Sainte Luce littoral Forest (SLLF), South East Madagascar. The SLLF is severely threatened by deforestation¹, fragmentation² and degradation and without intervention, it is predicted a further 80% of it will be lost by 2072³. Through connecting isolated forest patches with corridors, the project aims to increase viable lemur habitat, reunite discontinuous lemur sub-populations in the SLLF ecosystem, and thus secure the long-term futures of the four local lemur species, two of which are endangered⁴ and one which is a candidate new species of mouse lemur. Additionally, habitat corridors will benefit many other endemic flora and fauna species which are unable to disperse between habitat patches.

Target beneficiaries:

Project Ala will take place in Sainte Luce and will run a community engagement programme, including; education sessions for community members in forest threats, capacity building workshops for key stakeholders and annual mass mobilisation events to sensitise the wider community to environment and conservation issues. Project Ala will also run forest-based environmental education sessions in the free weekly conservation club and establish tree nurseries in two local schools as a practical demonstration of reforestation for the younger generation.

Objectives:

- I. Four wildlife corridors connect five forest fragments, increasing overall forest connectivity and supporting the movement of species, with a focus on endangered lemur species
- II. Sustainable, long-term SLLF management strategies are developed and implemented by informed and engaged community members and local stakeholders
- III. SEED actively contributes to global conservation research on forest corridor effectiveness and biodiversity conservation strategies, with a focus on lemur conservation

Activities:

- Collect and plant 10,000 acacia and 10,000 native seeds in SEED's nursery
- Firebreak assessment with COBA and FIMPIA, by month 3 and construction of 16.6km of new firebreaks around corridors and remnants and erection of 30 fire mitigation signs
- Clear and plant four corridor sites (total area ~0.86ha) with Acacia and native seedlings and seeds, increasing protected forest habitat by 45.07ha (107%)
- Sensitise 200 community members in environmental issues through 6 education sessions
- Engage 2000 community members with conservation issues, through 4 mobilisation events
- Educate 200 young people in forest threats, tree lifecycles and lemur conservation
- Train 20 key stakeholders in forest threat mitigation and management strategies, through 6 workshops
- Monitoring of population abundance and distribution of lemur species, flora and fauna diversity and abundance in corridors, fragments and remnants, long-term wildlife corridor effectiveness and forest structure and composition
